| % | Percentage (proportion) |

1 Introduction

1.1 Project background

- 1.1.1.1 Ørsted Hornsea Project Four Ltd., (the Applicant) is proposing to develop the Hornsea Project Four offshore wind farm (hereafter Hornsea Four). Hornsea Four is located approximately 65 km offshore from coastline of the East Riding of Yorkshire in the Southern North Sea with the array area covering an area of approximately 600 km² and will be the fourth project to be developed in the former Hornsea Zone. Hornsea Four will include both offshore and onshore infrastructure including an offshore generating station (wind farm), export cables to landfall, and connection to the electricity transmission network.
- 1.1.1.2 APEM Ltd (hereafter APEM) was commissioned by the Applicant to undertake a study of offshore and intertidal ornithology that characterise the area that may be influenced by Hornsea Four. A separate report ([Volume 5, Annex 5.1: Offshore and Intertidal Ornithology Baseline Characterisation Report](#)) provides the findings from offshore and intertidal ornithology data to determine the receptors that characterise the baseline and are of relevance to the assessment of potential impacts from Hornsea Four at the Preliminary Environmental Information Report (PEIR) stage.

1.2 Collision Risk Modelling

- 1.2.1.1 There is potential risk to birds from offshore wind farms through collision with wind turbines and associated infrastructure. There is an increase in potential risk of collision with wind turbines if they are located in areas of high bird densities in which there is a high level of flight activity. That high level of flight activity can be associated with locations where food supplies are concentrated or with areas where there is a high turnover of individuals (possibly commuting daily between nesting and feeding areas or passing through the area on seasonal migrations). The potential collision risk can be estimated using collision risk modelling (CRM).
- 1.2.1.2 CRM has been carried out for Hornsea Four to provide information for five seabird species of interest identified as potentially at risk and of interest for impact assessment through the evidence plan process (at Technical Panel Meeting 3 on 10.04.19); gannet, kittiwake, lesser black-backed gull, herring gull and great black-backed gull. CRM was undertaken using the Stochastic Collision Risk Model (sCRM), developed by Marine Scotland (McGregor, 2018), for each seabird species, to determine the risk of collision when in flight.

- 1.2.1.3 Historically, the Band (2012) model in Microsoft Excel format was used for informing collision risk of seabirds in potential offshore wind farm developments. Masden (2015) developed the Band (2012) model through the creation of the package 'BandModel' in the R statistical program (<http://www.r-project.org>). This was in response to feedback from stakeholder interviews that the Band (2012) model was occasionally difficult to use and error prone. In addition, the Masden (2015) version of the Band (2012) model required uncertainty to be accounted for in the form of Standard Deviations (SD) around input parameters and applied a method of Monte Carlo simulation used by McAdam (2005) to allow for these. Following a review funded by Natural England of the Masden (2015) programme undertaken by MacArthur Green (Trinder, 2017), it was determined that a number of improvements were required before the 'BandModel' R package would be deemed as the agreed method for collision risk modelling for the basis of the assessment of collision mortality rates from proposed offshore wind farm developments.
- 1.2.1.4 Marine Scotland aimed to improve estimates of CRM models by commissioning an additional working group to address the errors that were present in the Masden (2015) code as well as to develop a 'shinyapp' interface (McGregor, 2018). The 'shinyapp' interface is a user-friendly graphical user interface accessible via a standard web-browser that uses an R code to estimate collision risk. The advantages are that users are not required to use any R code, are not required to install or maintain R and updates to the model are made directly to the server, so are immediately programmed to users (Donovan, 2018). The work funded by Marine Scotland is the most up-to-date development of the CRM originally created by Band (2012) and addressed the uncertainty in developments and other key input parameters as progressed initially by Masden (2015). Through the evidence plan process (at Technical Panel Meeting 3 on 10.04.19) it was agreed with Natural England and the Royal Society for the Protection of Birds (RSPB) that this newly developed sCRM would be the method used to determine collision risk for Hornsea Four.

2 Methodology

2.1 Guidance and Models

- 2.1.1.1 The guidance document outlined by Marine Scotland (Donovan, 2018) has been followed for the modelling and assessment of impacts predicted for Hornsea Four.
- 2.1.1.2 The parameters used in the Band CRM are presented in [Sections 2.1](#) to [2.5](#). Five species were used for the CRM: gannet, kittiwake, lesser black-backed gull, herring gull and great black-backed gull. Fulmar was excluded because there were no individuals recorded at the height with highest potential risk, using the site-specific boat flight height data (HiDef BioConsult, 2018a), and therefore it was not possible to run through the sCRM shinyapp.
- 2.1.1.3 Within this report the shinyapp outputs / results for three different Band Options are presented, as described in the following sections.

2.1.2 Basic Band CRM Option 1 with site-specific flight heights

- 2.1.2.1 The Basic Band model applies a uniform distribution of bird flights between the lowest and the highest levels of the rotors. The percentage of bird flights passing between the lowest and the highest levels of the rotors (i.e. the proportion of birds at potential collision height (PCH)) is determined from the observations of bird flight heights made from the boat-based site-specific surveys. This Option has been considered for all five seabird species.

2.1.3 Basic Band CRM Option 2 with generic flight heights

2.1.3.1 The Basic Band model applies a uniform distribution of bird flights between the lowest and the highest levels of the rotors. The PCH was determined from the results of the SOSS-02 project (Cook *et al.*, 2012) that analysed the flight height measurements taken from boat surveys conducted around the UK. The project was updated following Johnston *et al.*, (2014), and the revised published spreadsheet¹ is used to determine the 'generic' percentage of flights at PCH for each species based on the proposed project's wind turbine parameters. This Option has been considered for all five seabird species.

2.1.4 Extended Band CRM Option 3 with generic flight heights

2.1.4.1 The Extended Band model accounts for the skewed vertical distribution of bird flight heights between the lowest and the highest levels of the rotors. Most seabird species are observed flying more frequently at the lower level of the rotor swept height (i.e. closer to the sea surface) than at heights equivalent to the rotor hub height or at the upper levels of the rotor and the probability of being struck by the moving rotor varies with vertical position. Extended Band Option 3 uses the data spreadsheet² that accompanies Johnston *et al.*, (2014) which is the result of a statistical analysis of a large number of boat surveys across multiple study sites. This data is fed into the model in order to allow for the flight distribution to be calculated based upon the windfarm parameters of the proposed project.

2.1.4.2 Option 3 has only been considered for kittiwake, lesser black-backed gull, herring gull, and great black-backed gull as per Statutory Body advice (JNCC *et al.*, 2014 in response to Cook *et al.*, 2014; Bowgen & Cook, 2018).

2.2 CRM Input Parameters

2.2.1.1 This report presents sCRM results based on input parameters supported by recent evidence in the literature (for instance in Bowgen & Cook, 2018 and Skov *et al.*, 2018). More specifically, the input parameters used to define the collision risk within this report rely on alternate nocturnal activity rates for all five species and alternate avoidance rates, which have been applied within the basic and extended models dependent upon the latest species-specific evidence detailed in [Table 2](#). For the avoidance of doubt, this evidence-based approach represents the CRM approach for Hornsea Four and the corresponding outputs are those taken forward to the detailed assessment phase in the PEIR ([Volume 5, Chapter 5: Offshore and Intertidal Ornithology](#)).

2.2.1.2 A second iteration of the sCRM (0) has been provided which incorporates input parameters currently advocated for use by SNCBs. The sCRM was run for each species with these input parameters in agreement with Natural England and the RSPB through the evidence plan process (at Technical Panel Meeting 4 on 11.06.19) in order to provide their more precautionary range of outputs.

¹ Final_Report_SOSS02_FlightHeights2014.xls

² Final_Report_SOSS02_FlightHeights2014.xls

2.2.2 Avoidance Rates

2.2.2.1 The species-specific avoidance rates that were applied in the CRM are presented in [Table 1](#). The avoidance rate for use in the gannet sCRM follows the guidance from Cook *et al.*, (2014) and the SNCBs review of avoidance rates to be applied in the Band models (JNCC *et al.*, 2014 in response to Cook *et al.*, 2014). The avoidance rates from Bowgen & Cook (2018) were applied in the sCRM for kittiwake, lesser black-backed gull, herring gull, and great black-backed gull. Bowgen & Cook (2018) presented upper and lower confidence intervals around the avoidance rates and as such a calculation assuming a normal distribution was undertaken to estimate a standard deviation for input to the sCRM ([Table 1](#)).

Table 1: Basic and Extended CRM Option associated avoidance rates for Hornsea Four for six species: gannet, kittiwake, lesser black-backed gull, herring gull, and great black-backed gull.

| Species | Basic Band Option Avoidance Rates (\pm SD) | Extended Band Option Avoidance Rate (\pm SD) |
|--------------------------|---|---|
| Gannet | 0.989 \pm 0.002 | n/a ¹ |
| Kittiwake | 0.994 \pm 0.0055 | 0.970 \pm 0.0295 |
| Lesser black-backed gull | 0.997 \pm 0.00175 | 0.990 \pm 0.00525 |
| Herring gull | 0.997 \pm 0.00175 | 0.990 \pm 0.00525 |
| Great black-backed gull | 0.997 \pm 0.00175 | 0.990 \pm 0.00525 |

¹A default value of 1 \pm 0 was inserted for these species so that all possible fields were completed for the shinyapp to run

2.2.3 Species Biometrics

2.2.3.1 The species-specific biometric input parameters used in the CRM are provided in [Table 2](#).

Table 2: Species biometrics used in the collision risk modelling of the proposed Hornsea Four for five species: gannet, kittiwake, lesser black-backed gull, herring gull, and great black-backed gull.

| Species | Body Length (m) ¹ \pm SD ² | Wingspan (m) ¹ \pm SD ² | Flight Speed (ms ⁻¹) ³ \pm SD | Nocturnal Activity \pm SD | Flight Type |
|--------------------------|--|---|--|---------------------------------|-------------|
| Gannet | 0.94 \pm 0.0325 | 1.72 \pm 0.0375 | 14.90 \pm 0.00 ³ | 0.00 \pm 0 ⁶ | Gliding |
| Kittiwake | 0.39 \pm 0.005 | 1.08 \pm 0.04 | 7.26 \pm 0.40 ⁴ | 0.033 \pm 0.0045 ⁴ | Flapping |
| Lesser black-backed gull | 0.58 \pm 0.03 | 1.42 \pm 0.0375 | 13.10 \pm 1.90 ⁵ | 0.25 \pm 0 ⁶ | Flapping |
| Herring gull | 0.60 \pm 0.0225 | 1.44 \pm 0.03 | 12.80 \pm 1.80 ⁵ | 0.25 \pm 0 ⁶ | Flapping |
| Great black-backed gull | 0.71 \pm 0.035 | 1.58 \pm 0.0375 | 13.70 \pm 1.20 ⁵ | 0.25 \pm 0 ⁶ | Flapping |

¹Robinson (2005); ²Marine Scotland (2018); ³Pennyquick (1997); ⁴Masden (2015); ⁵Alerstam *et al.*, (2007); ⁶Garthe & Hüppop (2004).

2.2.3.2 The body length and wingspan of the five key seabirds included in the collision risk modelling were derived from Robinson (2005). Automatic inputs for the SD of these parameters were retained from Marine Scotland (2018).

- 2.2.3.3 Flight speeds and associated standard deviations for lesser black-backed gull, herring gull, and great black-backed gull were derived from Alerstam *et al.*, (2007). The flight speed for gannet was derived from Pennycuick (1997). The flight speed for kittiwake is reduced in comparison to the previously used estimate of 13.1 m/s from Alerstam *et al.*, (2007) based on recent literature (Masden, 2015; Skov *et al.*, 2018).
- 2.2.3.4 The nocturnal activity rate for gannet, lesser black-backed gulls, herring gull, and great black-backed gulls was based on a 1 to 5 scoring index for each species in Garthe and Hüppop (2004) or King *et al.*, (2009), with the spreadsheet converting these factors into nocturnal activity as follows; 1 = 0%, 2 = 25%, 3 = 50%, 4 = 75%, 5 = 100%. It is considered that these literature sources for nocturnal activity rates are overly precautionary (gannet: 2, kittiwake: 3, and large gulls: 3) and have been superseded by more recent studies (MacArthur Green, APEM & Royal HaskoningDHV, 2015; Skov *et al.*, 2018; Masden, 2015). They were considered precautionary for the East Anglia THREE application based on a review of information from data loggers deployed on kittiwakes, gannets, and lesser black-backed gulls (MacArthur Green, 2015). The results indicated that the nocturnal activity of these species was less than what was assumed to be the case in Garthe & Hüppop (2004). MacArthur Green (2015) argued that the simplistic categorical factors in Garthe & Hüppop (2004) were not intended to represent a scale of 0 to 100%. Similarly, Masden (2015) presented information from data loggers for the nocturnal activity of kittiwake in the species example provided for the sCRM. Skov *et al.* (2018) provided information that indicated nocturnal flight activity recorded from thermal videos constituted a negligible proportion of total flight activity (<3%), but sample size was a limitation and therefore concluded this information should be interpreted as anecdotal. As such the nocturnal activity rates used for the sCRM presented in this report follow more recent evidence, which are collated and presented in [Table 2](#).

2.2.4 Proportion at Potential Collision Height

- 2.2.4.1 The proportion of individuals flying at PCH for use in Band Option 1 for each species were obtained from the site-specific boat based derived flight heights ([Table 3](#)), which provides a generic PCH per species which is in this model. It was not possible to calculate a SD around the PCH for the site-specific data due to the nature of boat-based flight height estimates being within flight height band categories.
- 2.2.4.2 To determine the proportion of birds at potential collision risk height (based on 35 m against Lowest Astronomical Tide (LAT)) for all five species, it was necessary to convert the lower rotor swept value against Mean Sea Level (MSL), a requirement for the sCRM, which was calculated to be 32.57 m. To calculate PCH, the number of records across the year and from the flight height category "32.5 – 37.5 m" were summed and divided by the total recorded for each species.

Table 3: Proportion (%) at PCH used in the Band CRM Option 1 of the proposed Hornsea Four development.

| Species | Boat-based site-specific PCH |
|--------------------------|------------------------------|
| Gannet | 0.034 ± 0 |
| Kittiwake | 0.005 ± 0 |
| Lesser black-backed gull | 0.088 ± 0 |
| Herring gull | 0.1215 ± 0 |

| Species | Boat-based site-specific PCH |
|-------------------------|------------------------------|
| Great black-backed gull | 0.1721 ± 0 |

2.2.5 Density of Birds in Flight

2.2.5.1 Design-based abundance and density estimates +/- SD were determined for Hornsea Four using data collected from the 24-month programme of digital aerial video surveys (carried out between April 2016 and March 2018, inclusive), which are presented in ([Volume 2, Chapter 5, Annex 1](#)). For the five species of key seabirds, the CRM is based on the mean density of flying birds per month ([Table 4](#)). The SD was calculated using two flying density estimates for each month from the two different years of survey data and per species ([Table 4](#)).

Table 4: Monthly values for the mean density +/- SD of flying birds used in the CRM of the proposed Hornsea Four development for five species: gannet, kittiwake, lesser black-backed gull (LBB gull), herring gull (H gull), and great black-backed gull (GBB gull).

| Month | Gannet | Kittiwake | LBB Gull | H Gull | GBB Gull |
|-----------|-------------|-------------|-------------|-------------|-------------|
| January | 0.12 ± 0.16 | 0.23 ± 0.05 | 0.00 ± 0.00 | 0.00 ± 0.00 | 0.14 ± 0.04 |
| February | 0.03 ± 0.04 | 0.35 ± 0.43 | 0.00 ± 0.00 | 0.00 ± 0.00 | 0.02 ± 0.00 |
| March | 0.14 ± 0.11 | 0.34 ± 0.13 | 0.00 ± 0.00 | 0.01 ± 0.01 | 0.04 ± 0.01 |
| April | 0.06 ± 0.01 | 1.34 ± 1.47 | 0.00 ± 0.00 | 0.00 ± 0.00 | 0.00 ± 0.00 |
| May | 0.15 ± 0.16 | 2.20 ± 0.25 | 0.01 ± 0.01 | 0.00 ± 0.00 | 0.01 ± 0.01 |
| June | 0.50 ± 0.54 | 1.41 ± 0.75 | 0.03 ± 0.04 | 0.03 ± 0.04 | 0.02 ± 0.02 |
| July | 0.55 ± 0.09 | 0.96 ± 0.05 | 0.00 ± 0.00 | 0.00 ± 0.00 | 0.00 ± 0.00 |
| August | 0.46 ± 0.34 | 2.51 ± 0.86 | 0.01 ± 0.01 | 0.00 ± 0.00 | 0.00 ± 0.00 |
| September | 0.18 ± 0.02 | 0.58 ± 0.78 | 0.00 ± 0.00 | 0.01 ± 0.01 | 0.00 ± 0.00 |
| October | 0.20 ± 0.14 | 0.13 ± 0.09 | 0.00 ± 0.00 | 0.00 ± 0.00 | 0.01 ± 0.01 |
| November | 0.48 ± 0.05 | 0.26 ± 0.32 | 0.00 ± 0.00 | 0.00 ± 0.00 | 0.10 ± 0.07 |
| December | 0.29 ± 0.32 | 0.95 ± 0.62 | 0.00 ± 0.00 | 0.02 ± 0.02 | 0.13 ± 0.01 |

2.2.6 Turbine Parameters

2.2.6.1 Input parameters for the wind turbine specifications used within the CRM are shown in [Table 5](#) and [Table 6](#).

Table 5: Wind turbine specification for the proposed Hornsea Four development.

| Input Parameter (units in brackets) | Value | Source |
|-------------------------------------|-------|--|
| No. of Blades | 3 | Provided by Hornsea Four. |
| Rotor Radius (m) | 152.5 | Provided by Hornsea Four. |
| Air Gap (m) | 30.29 | Air gap measured against Highest Astronomical Tide (HAT); 35 m air gap provided by Hornsea Four based on Lowest Astronomical Tide [LAT], tidal offset of 4.71 m used for conversion as supplied by Hornsea Four. |
| Max. Blade Width (m) | 6 | Provided by Hornsea Four. |
| Tidal Offset (m) | 2.28 | To correct for flight heights calculated against Mean Sea Level (MSL; site-specific data assumed to be measured against MSL) and air gap in relation to HAT. Difference |

| Input Parameter (units in brackets) | Value | Source |
|-------------------------------------|------------|---|
| | | between HAT and MSL as provided by Hornsea Four (4.71 m and 2.43 m respectively). |
| Wind Farm Width (km) | 53.063643 | See Figure 1 |
| Latitude (degrees) | 54.092594 | Latitude of the centroid of Hornsea Four, Figure 1 . Latitude informs daylight hours in the Band Model calculation. Longitude is not a requirement of the Band CRM input. |
| Rotation speed (rpm) | 6.5 ± 0.2 | Provided by Hornsea Four. |
| Large Array Correction | Yes | Standard procedure. |
| Pitch (°) | 4.6 ± 1.0 | Provided by Hornsea Four. |
| Wind speed (ms ⁻¹) | 11.2 ± 0.5 | Provided by Hornsea Four. |

2.2.6.2 Wind farm width was calculated using the longest distance across the wind farm which is worst case as this maximises the amount of time a bird could spend in the wind farm ([Figure 1](#)). The latitude was calculated from the shapefile provided by Hornsea Four and represents the centroid ([Figure 1](#)).

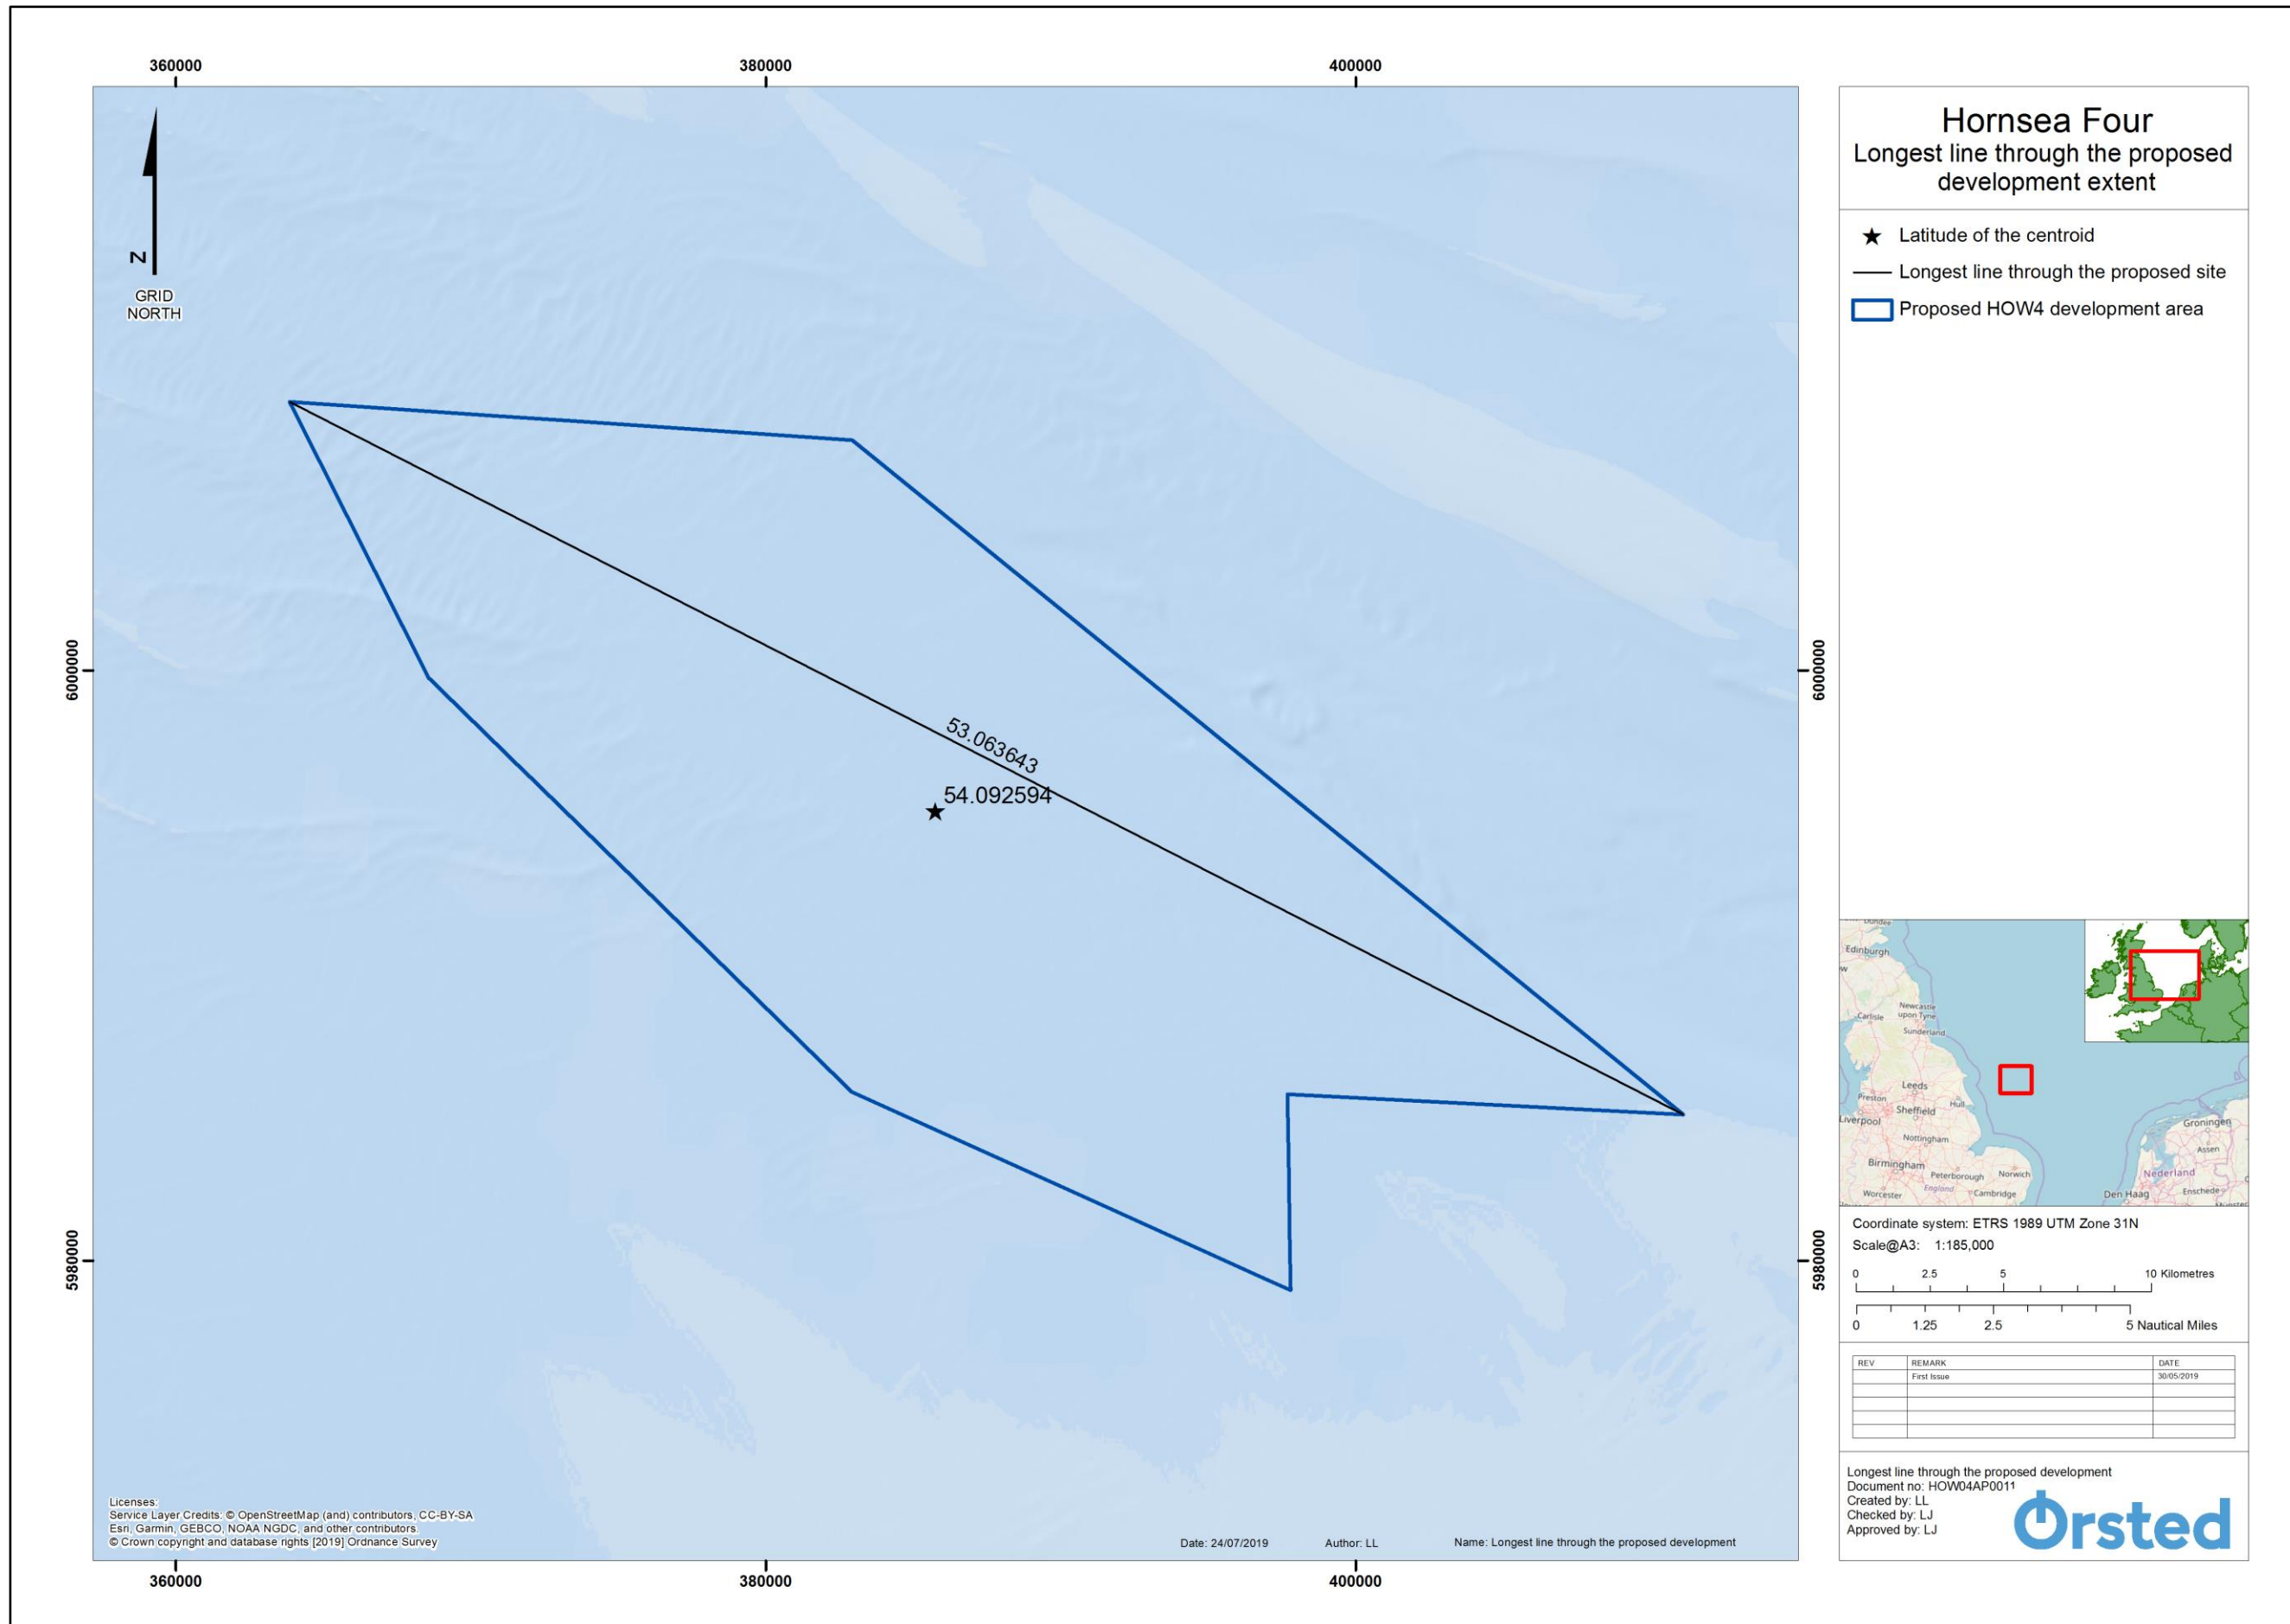

Figure 1: The proposed Hornsea Four development: the line used to estimate the longest distance through the wind farm (not to scale).

Table 6: Theoretical operational time of the proposed Hornsea Four turbines as provided by Hornsea Four.

| Month | Wind Availability (%) | Mean Downtime ± SD (%) |
|-----------|-----------------------|------------------------|
| January | 92.15 | 4 ± 2 |
| February | 92.58 | 4 ± 2 |
| March | 92.42 | 4 ± 2 |
| April | 91.46 | 4 ± 2 |
| May | 91.25 | 4 ± 2 |
| June | 90.04 | 4 ± 2 |
| July | 89.87 | 4 ± 2 |
| August | 90.49 | 4 ± 2 |
| September | 91.75 | 4 ± 2 |
| October | 92.61 | 4 ± 2 |
| November | 92.60 | 4 ± 2 |
| December | 92.45 | 4 ± 2 |

3 Results

3.1 Introduction

3.1.1.1 This section provides the standard outputs from the CRM for each of the five seabird species. To interpret the boxplots: the 'box' is the interquartile range which represents the middle half of the data, with the middle bold line representing the median. The 'whiskers' are the largest and smallest non-outliers. The range of the entire data includes the outliers represented by circles. The density plots provide a visual representation of the distribution of data, the peak of the density plot displays where values are concentrated over the interval.

3.2 Gannet

3.2.1.1 **Table 7** presents the annual gannet collision rates for Option 1 and Option 2. **Figure 2** presents the gannet annual collision probability density for Option 1 and Option 2. Monthly collision rates for Option 1 and Option 2 are presented in **Figure 3** and **Figure 4** respectively.

3.2.1.2 **Appendix B** details the monthly CRM, bird parameter and turbine parameter outputs for gannet.

Table 7: Gannet overall collisions.

| Option | Mean | SD | CV | Median | 2.50% | 25% | 75% | 97.50% |
|----------|--------|--------|-------|--------|--------|--------|--------|---------|

Appendix A - SNCB Parameters CRM Outputs

1 Introduction to Second sCRM Iteration

1.1.1.1 This Appendix presents sCRM results based on the input parameters currently advocated for use by SNCBs. This iteration of the sCRM was run for each species with these input parameters in agreement with Natural England and the RSPB through the evidence plan process (at Technical Panel Meeting 4 on 11.06.19) in order to provide their more precautionary range of outputs.

1.1.1.2 Results from the first iteration of the sCRM (termed: evidence-based approach) has been provided as the main body of this report which incorporates more recent evidence from the literature that is considered within the impact assessments concerned with collision risk. The outputs presented use a reduced nocturnal activity rate for all five species in addition to an increase in avoidance rates in the basic and extended avoidance rates for kittiwake, lesser black-backed gull, herring gull, and great black-backed gull (Masden, 2015; Bowden & Cook, 2018; Skov *et al.*, 2018). In recognition of the evidence led approach to CRM (**Volume 2, Chapter 5: Offshore and Intertidal Ornithology**) the results presented in this Appendix should therefore be considered overly precautionary.

2 Methodology of Second sCRM Iteration

2.1.1.1 The input parameters that have been altered to inform the first (evidence based) and second (SNCB) iterations of the sCRM are presented in **Table A 1**. All other input parameters remained the same.

Table A 1: Summary of the input parameters for the first (evidence-based) and second (SNCB) iteration of the sCRM for Hornsea Four for six species: gannet, kittiwake, lesser black-backed gull (LBB Gull), herring gull (H Gull), and great black-backed gull (GBB Gull).

| Input Parameter | Gannet | Kittiwake | LBB Gull | H Gull | GBB Gull |
|---|---------------------------|-----------------------------|---------------------------|---------------------------|---------------------------|
| Basic Avoidance Rate: First Iteration | 0.989 ± 0.002 | 0.994 ± 0.0055 | 0.997 ± 0.00175 | 0.997 ± 0.00175 | 0.997 ± 0.00175 |
| Basic Avoidance Rate: Second Iteration | 0.989 ± 0.002 | 0.989 ± 0.002 | 0.995 ± 0.001 | 0.995 ± 0.001 | 0.995 ± 0.001 |
| Extended Avoidance Rate: First Iteration | n/a ¹ | 0.970 ± 0.0295 | 0.990 ± 0.00525 | 0.990 ± 0.00525 | 0.990 ± 0.00525 |
| Extended Avoidance Rate: Second Iteration | n/a ¹ | n/a ¹ | 0.989 ± 0.002 | 0.990 ± 0.002 | 0.989 ± 0.002 |
| Nocturnal Activity: First Iteration | 0.00 ± 0 ⁶ | 0.033 ± 0.0045 ⁴ | 0.25 ± 0 ⁶ | 0.25 ± 0 ⁶ | 0.25 ± 0 ⁶ |
| Nocturnal Activity: Second Iteration | 0.25 ± 0 | 0.50 ± 0 | 0.50 ± 0 | 0.50 ± 0 | 0.50 ± 0 |
| Flight Speed: First Iteration | 14.90 ± 0.00 ³ | 7.26 ± 0.40 ⁴ | 13.10 ± 1.90 ⁵ | 12.80 ± 1.80 ⁵ | 13.70 ± 1.20 ⁵ |
| Flight Speed: Second Iteration | 14.90 ± 0.00 ³ | 13.10 ± 0.40 ⁴ | 13.10 ± 1.90 ⁴ | 12.80 ± 1.80 ⁴ | 13.70 ± 1.20 ⁴ |

3 Results of Second sCRM Iteration

3.1 Introduction

3.1.1.1 This section provides the standard outputs from the evidence based second iteration of the sCRM for each of the five seabird species. To interpret the boxplots: the 'box' is the interquartile range which represents the middle half of the data, with the middle bold line representing the median. The 'whiskers' are the largest and smallest non-outliers. The range of the entire data includes the outliers represented by circles. The density plots provide a visual representation of the distribution of data, the peak of the density plot displays where values are concentrated over the interval.

3.2 Gannet

3.2.1.1 **Table A 2** presents the annual gannet collision rates for Option 1 and Option 2. **Figure A 1** presents the gannet annual collision probability density for Option 1 and Option 2. Monthly collision rates for Option 1 and Option 2 are presented in **Figure A 2** and **Figure A 3** respectively.

3.2.1.2 **Appendix B** details the monthly CRM, bird parameter and turbine parameter outputs for gannet.

Table A 2: Gannet overall collisions.

| Option | Mean | SD | CV | Median | 2.50% | 25% | 75% | 97.50% |

3.4 Lesser black-backed gull

3.4.1.1 **Table A 12** presents the annual lesser black-backed gull collision rates for Option 1 and Option 2. **Figure A 7** presents the lesser black-backed gull annual collision probability density for Option 1, Option 2, and Option 3. Monthly collision rates for Option 1, Option 2, and Option 3 are presented in **Figure A 8**, **Figure A 9** and **Figure A 10** respectively.

3.4.1.2 **Appendix D** details the monthly CRM, bird parameter and turbine parameter outputs for lesser black-backed gull.

Table A 12: Lesser black-backed gull overall collisions.

| Option | Mean | SD | CV | Median | 2.50% | 25% | 75% | 97.50% |

3.6 Great black-backed gull

3.6.1.1 **Table A 24** presents the annual Great black-backed gull collision rates for Option 1, Option 2, and Option 3. **Figure A 15** presents the Great black-backed gull annual collision probability density for Option 1, Option 2, and Option 3. Monthly collision rates for Option 1, Option 2, and Option 3 are presented in **Figure A 16**, **Figure A 17**, and **Figure A 18** respectively.

3.6.1.2 **Appendix F** details the monthly CRM, bird parameter and turbine parameter outputs for great black-backed gull.

Table A 24: Great black-backed gull overall collisions.

| Option | Mean | SD | CV | Median | 2.50% | 25% | 75% | 97.50% |
|----------|--------|-------|-------|--------|-------|--------|--------|--------|
| Option 1 | 16.753 | 4.371 | 0.261 | 16.246 | 9.35 | 13.779 | 19.383 | 26.707 |
| Option 2 | 16.641 | 5.199 | 0.312 | 16.061 | 8.525 | 12.987 | 19.567 | 29.882 |
| Option 3 | 10.525 | 3.99 | 0.379 | 9.787 | 4.79 | 7.689 | 12.483 | 20.532 |

Figure A 15: Great black-backed gull overall collisions probability density.
