

Geotechnical Surveys & Site Evaluation

Purpose

South Fork Wind is gathering soil samples to collect the data that will inform the detailed design of the onshore cable route.

To acquire these samplings, soil borings will be taken along portions of the planned cable route. Each boring will be an approximately two-inch wide hole and approximately 15-25 feet deep. The exact boring locations may be modified to accommodate site conditions and to minimize impacts to the site during sampling.

Minor brush clearing will be required to access many of the boring locations, but will only include low brush. Trees or high branches will not be removed during the clearing.

The borings will be backfilled once completed. If contamination occurs, the soil will be responsibly disposed of at an approved solid waste facility.

Timeline & Location

→ LONG ISLAND RAIL ROAD RIGHT-OF-WAY

23 borings will be performed using a track-mounted drill rig at locations along the Long Island Railroad right-of-way between Wainscott Northwest Road and Cove Hollow Road.

There will be no road closures or impacts to train schedules.

Timeline: Beginning as early as July 26, 2021 and is anticipated to be completed within 3-weeks.

All work will be conducted Monday through Friday between 7:00 AM and 7:00 PM.
