

Field Surveys & Site Evaluation

Purpose

South Fork Wind is performing nearshore geotechnical surveys to inform the cable landing.

The work will be performed by a lift boat named the Laredo Brazos – a barge that can stand out of the water for protection from wave action.

The surveys will consist of three soil borings of the seafloor.

Timeline & Location

→ The soil borings will be taken at points 780 feet, 1470 feet, and 2,160 feet from shore, directly off the Wainscott Beach.

Timeline: The vessel first arrived in the area off Wainscott Beach on November 15 and began work on November 16. On November 24, the vessel moved west to the area off Smith Point Beach in the Town of Brookhaven to perform a similar scope for another project. The vessel will return to the area off Wainscott Beach to complete its planned geotechnical assessment work in early to mid-December, weather depending.

The barge, as well as a smaller vessel named the Kristen Miller, will be visible from shore during this time.
