

Location of Underground Utilities

Purpose

Sunrise Wind will be digging investigation holes to locate and confirm the depth of existing underground utilities.

To acquire these samplings, soil borings will be taken along the planned cable route. Test pit samples will be taken using a combination of hand tools, including shovels, jackhammers and vacuum excavation equipment. Test pits will be just large enough to collect all required information and utilities will be measured, photographed and GPS located. There will be road closures required and travel lanes will be maintained to accommodate emergency vehicles, access to homes and other public access.

The borings will be backfilled once completed and our contractor will responsibly dispose of any drill spoils generated from the activities at an approved solid waste facility. The surface will be restored to original condition once work is completed.
